

# Instruction-level parallelism: Tomasulo

**Dr. Tao Xie**

These slides are adapted from notes by Dr. David Patterson (UCB) and Dr. Xiao Qin (Auburn)

# Limitations of Scoreboard

- The amount of parallelism available among the instructions (chosen from the same basic block)
- The number of score entries (The size of the scoreboard determines the size of the window)
- The number and types of functional units (Structural hazards increase when dynamic scheduling is used)
- The presence of anti-dependence and output dependences lead to WAR and WAW stalls.

# Scoreboard - Summary

- Techniques to deal with data hazards in instruction pipelines by:
  - Result **forwarding** to reduce or eliminate RAW hazards
  - Hazard detection hardware to **stall the pipeline** during hazards
  - Compiler-based **static scheduling** to separate the dependent instructions minimizing actual hazard-prevention stalls in scheduled code.
  - Uses a hardware-based mechanism to rearrange instruction execution order to reduce stalls dynamically at runtime (**dynamic scheduling**)
    - Better dynamic exploitation of instruction-level parallelism (ILP)
    - We learned scoreboard techniques
    - We will learn another technique Tomasulo next.

# A Dynamic Algorithm: Tomasulo's Algorithm

- For IBM 360/91 (before caches!)
- Goal: High Performance without special compilers
- Small number of floating point registers (4 in 360) prevented interesting compiler scheduling of operations
  - This led Tomasulo to try to figure out how to get more effective registers — **renaming in hardware!**
- Why Study 1966 Computer?
- The descendants of this have flourished!
  - Alpha 21264, HP 8000, MIPS 10000, Pentium III, PowerPC 604, ...

[Goto 7](#)

# IBM 360

# Tomasulo's Algorithm

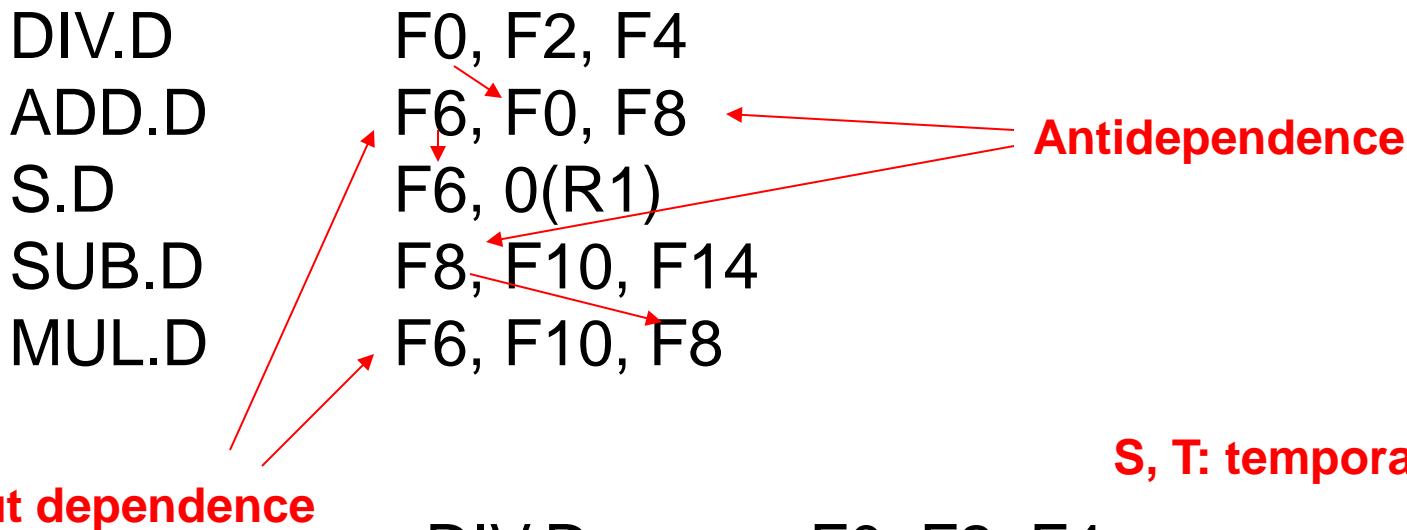

- Tracks when operands for instructions are available.
  - Minimizes RAW hazards.
  - Introduces register renaming to minimize WAW and WAR hazards.
- Supports the overlapped execution of multiple iterations of a loop.

# Avoiding Hazards

- RAW
  - Execute an instruction only when its operands are available.
- WAW and WAR
  - Register renaming

# Register Renaming (Example)

- Eliminates WAR and WAW hazards by renaming all destination registers.
- Can be done by compiler

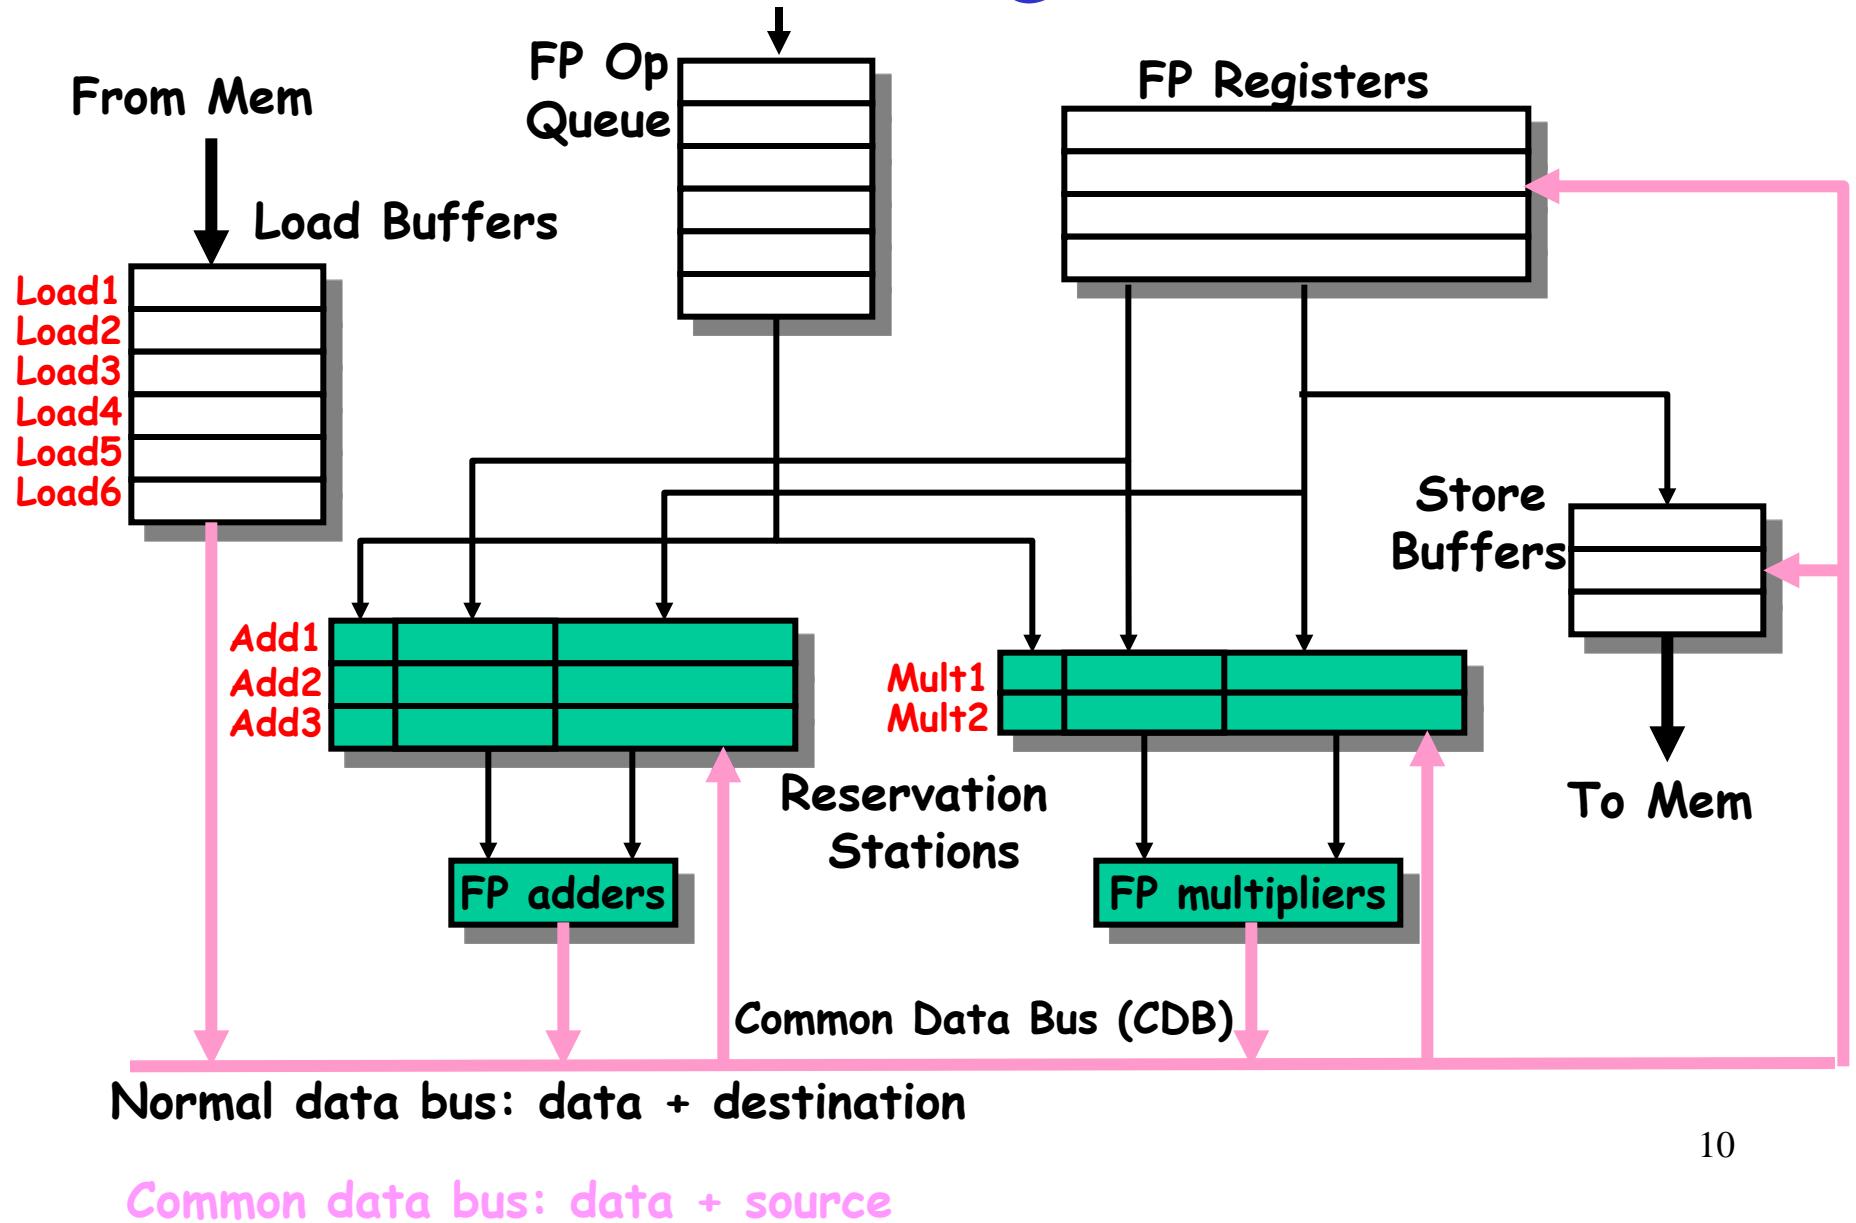

DIV.D	F0, F2, F4
ADD.D	S, F0, F8
S.D	S, 0(R1)
SUB.D	T, F10, F14
MUL.D	F6, F10, T

# Tomasulo's Algorithm

- Register renaming is provided by the *reservation stations*, which buffer the **operands** of instructions waiting to issue.
- Basic idea: A reservation station fetches and buffers an operand as soon as it is available, eliminating the need to get the operand from a register.

# Tomasulo Organization

# Tomasulo Algorithm

- Control & buffers distributed with Function Units (FU)
  - FU buffers called “reservation stations”; have pending operands
- Registers in instructions replaced by **values** or **pointers** to reservation stations(RS);
  - form of register renaming ;
  - avoids WAR, WAW hazards
  - more reservation stations than registers, so can do optimizations compilers can't
- Results to FU from RS, not through registers, over Common Data Bus that broadcasts results to all FUs
- Load and Stores treated as FUs with RSs as well

# Three Stages of Tomasulo Algorithm

## 1. Issue—get instruction from FP Op Queue

If reservation station free (no structural hazard),  
control issues instr & sends operands (renames registers).

## 2. Execute—operate on operands (EX)

When both operands ready then execute;  
if not ready, watch Common Data Bus for result

## 3. Write result—finish execution (WB)

Write on Common Data Bus to all awaiting units;  
mark reservation station available

- Normal data bus: data + destination (“go to” bus)
- Common data bus: data + source (“come from” bus)
  - 64 bits of data + 4 bits of Functional Unit source address
  - Write if matches expected Functional Unit (produces result)
  - Does the broadcast
- Example speed:  
3 clocks for FP+,-; 10 for \* ; 40 clks for /

# Reservation Station Components

**Op:** Operation to perform in the unit (e.g., + or -)

**V<sub>j</sub>, V<sub>k</sub>:** **Value** of Source operands

- Store buffers has V field, result to be stored

**Q<sub>j</sub>, Q<sub>k</sub>:** Reservation stations producing source registers (value to be written)

- Note: Q<sub>j</sub>, Q<sub>k</sub>=0 => ready
- Store buffers only have Q<sub>i</sub> for RS producing result

**A:** Used to hold information for the memory address calculation for a load or store

**Busy:** Indicates reservation station or FU is busy

**Register result status**—Indicates which functional unit will write each register, if one exists. Blank when no pending instructions that will write that register.

## Instruction stream

# Tomasulo Example

### Instruction status:

Instruction	j	k	Exec Write		
			Issue	Comp	Result

	Add1	No					
	Add2	No					
	Add3	No					
	Mult1	No					
40	Mult2	Yes	DIVD	M*F4	M(A1)		

*Register result status:*

Clock	<i>F0</i>	<i>F2</i>	<i>F4</i>	<i>F6</i>	<i>F8</i>	<i>F10</i>	<i>F12</i>	...	<i>F30</i>
<i>FU</i>	<i>M*F4</i>	<i>M(A2)</i>		(M-M+N	(M-M)	Mult2			
16									

- Just waiting for Mult2 (DIVD) to complete

Faster than light computation  
(skip a couple of cycles)

# Tomasulo Example Cycle 55

*Instruction status:*

Instruction	<i>j</i>	<i>k</i>	<i>Issue</i>	<i>Exec</i>	<i>Write</i>	<i>Busy</i>	<i>Address</i>	
				<i>Comp</i>	<i>Result</i>			
LD	F6	34+	R2	1	3	4	Load1	No

Clock	<i>F0</i>	<i>F2</i>	<i>F4</i>	<i>F6</i>	<i>F8</i>	<i>F10</i>	<i>F12</i>	...	<i>F30</i>
56	<i>FU</i>	M*F4	M(A2)		(M-M+N)	(M-M)	Mult2		

- Mult2 (DIVD) is completing; what is waiting for it?

# Tomasulo Example Cycle 57

*Instruction status:*

Instruction	<i>j</i>	<i>k</i>	Issue	Exec	Write	Busy	Address	
				Comp	Result			
LD	F6	34+	R2	1	3	4	Load1	No
LD	F2	45+	R3	2	4	5	Load2	No
MULTD	F0	F2	F4	3	15	16	Load3	No
SUBD	F8	F6	F2	4	7	8		
DIVD	F10	F0	F6	5	56	57		
ADDD	F6	F8	F2	6	10	11		

*Reservation Stations:*

Time	Name	Busy	Op	SI	S2	RS	RS
				Vj	Vk	Qj	Qk
	Add1	No					
	Add2	No					
	Add3	No					
	Mult1	No					
	Mult2	Yes	DIVD	M*F4	M(A1)		

*Register result status:*

Clock	F0	F2	F4	F6	F8	F10	F12	...	F30
56	FU	M*F4	M(A2)	(M-M+N	(M-M)	Result			

- Once again: In-order issue, out-of-order execution and out-of-order completion.

# Tomasulo Drawbacks

- Complexity
  - delays of 360/91, MIPS 10000, Alpha 21264, IBM PPC 620 in CA:AQA 2/e, but not in silicon!
- Many associative stores (CDB) at high speed
- Performance limited by Common Data Bus
  - Each CDB must go to multiple functional units  
⇒high capacitance, high wiring density
  - Number of functional units that can complete per cycle limited to one!
    - Multiple CDBs ⇒ more FU logic for parallel assoc stores
- Non-precise interrupts!
  - We will address this later
